Infection Canine Tracheobronchitis: According to ASPCA, “Kennel cough” is a term loosely used to describe a complex of respiratory infections – both viral and bacterial – that causes inflammation of a dog’s voice box and windpipe. It’s a form of bronchitis and is similar to a chest cold in humans. I understand that canine cough is unpreventable and there are over one hundred strains which are all an airborne virus and JVH is not responsible. If my pet shows symptoms of canine cough, JVH will make every effort to get your dog veterinary attention as soon as possible at the owner’s expense. I authorize JVH at JVH’s sole discretion, to take any steps necessary to isolate my pet to avoid further exposure to other pets in the facility. A cough suppressant or antimicrobial may be prescribed. In most cases, the signs of kennel cough gradually decrease and disappear after three weeks. Young puppies, elderly dogs and other immunocompromised animals may take up to six weeks or more to recover. Animals may remain infectious for long periods of time even after the symptoms have cleared. _____
